

Hi everyone. I'm here to explain friction and how the dirt bike is better at stopping on hard dirt. ~~Why this~~ <sup>Why this</sup> why ~~this~~ this project is going to help others is so new riders entering the rank can learn the best way to stop.

As you can see, this is my chart. It shows the shortest stopping and the longest stopping distances. The shortest is the hard dirt and I think that it was because the tires were covered with this thing that gave hard surfaces. The longest was the gravel and it was because the gravel is made out of many soft materials.

My hypothesis was incorrect because the soft dirt was the longest, the gravel was. The asphalt wasn't the shortest, the hard dirt was. Thanks for listening to this project!
